

COVID 19 VACCINES: ALL OF THE FACTS YOU NEED TO KNOW

10th March 2021

By Oliver Y and Mason U

Covid 19 is a massive thing right now on Planet Earth and many people are dying and people need to stay safe. The ways to stay safe are to obey the rules. But the main thing that we are going to focus on, are the vaccines. When the pandemic spread very quickly around the world there was a race between all the different countries to see who could come up with a vaccine that was safe and would protect as many people as possible from catching Covid 19.

There are two covid 19 vaccines available in Britain. These are the Pfizer vaccine and the Oxford Astrazeneca vaccine.

The pfizer vaccine is about 95% effective in preventing covid 19 and the Oxford Astrazeneca vaccine is between 60 to 90% effective in preventing covid 19. It is important to have the vaccine when you are offered it if you are able to, to protect you and those around you.

There have been 123k people who have died in Britain off covid 19 from the start. Regardless of which vaccine you get, you won't reach full protection until two weeks after your second or final dose. That's about how long it takes your immune system to mount an antibody response to the vaccine.

The three COVID-19 vaccines approved in the UK do not contain any animal products. You can read lists of the ingredients found in each of the vaccines. The website can also be used to report any side effects that you might experience after your vaccination.

You may be concerned about animal products. If this is because of your religious beliefs, it's worth noting that many religious leaders and faith organisations have encouraged followers to have a COVID-19 vaccine when one is offered.
